June 24, 2025

## 1 Introduction

Account enumeration is a security vulnerability enabling attackers to determine if specific user accounts exist on a service. The vulnerability usually lies in the account registration functionality of a service, where an error message is returned, indicating that a user with the specified account identifier is already registered. However, an online service can also leak this information in other, more subtle ways, which are often overlooked by software developers. For example, even without a direct message, small visual differences in responses, or slight variations in how the server behaves (like the exact data returned) for existing versus non-existing accounts, can still reveal if an account is registered.

On 2025-06-22, we reassessed **euronics.ee** and found that **the service is still vulnerable to account enumeration**.

If the account identifier of an online service is personal data (e.g. email address, personal code etc), then the fact, whether it is associated to an account, is also considered personal data. Any disclosure of personal data to third parties without a legal basis constitutes a data breach [1].

We advise you to investigate the potential data breach, and notify the supervisory authority and the affected data subjects, if necessary. Detailed guidelines for mitigating this type of flaw are available in [2].

## 2 Vulnerabilities Found

We tested the login form, password reset form and account registration form of **euronics.ee**. No issues appeared on the login form. However, we identified security issues on the password reset form and account registration form. The vulnerabilities found are described in more detail in subsections below.

## 2.1 Password Reset Form

The figure displays two versions of a password reset form titled "Unustatud parooli taastamine".

**Left Panel (When email is not registered):**

- Header: Unustatud parooli taastamine
- Section: KASUTAJANIMI (E-POST)
- Email Input: rebaseonu73+may00@gmail.com
- Error Message: Kui sisestatud e-posti aadressiga on registreeritud konto, siis saadeti parooli lähtestamise link teie e-posti aadressile.
- Form Elements: "I'm not a robot" checkbox, CAPTCHA, and "Saada e-postile" button.

**Right Panel (When email is registered):**

- Header: Unustatud parooli taastamine
- Message: Paroolivahetuse link saadetud e-posti aadressile rebaseonu73+may02@gmail.com

Figure 1: The vulnerability in the password reset form

The password reset form is susceptible to account enumeration attacks. This is because when a password reset is requested for an email address that is not registered with the service, the form shows an error message (see Figure 1).

Moreover, no confirmation email is sent to the provided email address after this form is submitted. This allows the attacker to verify registered email addresses, ensuring that the email owner remains unaware of the potential attack.

It is also crucial to eliminate any side-channels that an attacker could exploit to differentiate between account existence and non-existence. For example, the response should not be faster for an existing account than for an email with which an account does not exist.

**To mitigate the flaw**, the response must be uniform for both registered and unregistered email addresses. This uniformity must apply to the message displayed to the user as well as the underlying HTTP response details (like status codes, headers, and body content).

For example, the indistinguishable user-facing message could be: “A password reset link has been sent if an account with this email exists”. [2]

## 2.2 Account Registration Form

The screenshot shows a mobile application interface for 'eurionics'. At the top, there is a header with a close button (x), the word 'Minu', and the 'eurionics' logo. Below the header, there are two tabs: 'Logi sisse' and 'Registreeru'. The 'Registreeru' tab is active. Under this tab, there is a message: 'Vali sobiv meetod konto registreerimiseks. Juriidilise konto loomiseks vali E-post.' Below this message, there are three options: 'Mobiil-ID', 'Smart-ID', and 'E-post'. The 'E-post' option is selected, indicated by a minus sign. Below the options, there is a pink box with text: 'Antud e-postiga püsikliendikonto on juba kasutusel. Palun logige sisse olemasoleva püsikliendikontoga. Juhul kui parool on ununenud saate seda uuendada siit.' Below this box, there is a label 'E-post' and a text input field containing the email address 'rebaseonu73+may02@gmail.com'. At the bottom, there is a yellow button labeled 'Registreeru'.

Figure 2: The vulnerability in the account registration form

The account registration form is also susceptible to account enumeration attacks. This is because when the provided email address is already taken, the form shows an error message (see Figure 2). Additionally, the form appears to lack anti-bot measures such as CAPTCHA, enabling attackers to easily automate these attacks [3].

Moreover, no confirmation email is sent to the provided email address after this form is submitted. This allows the attacker to verify unregistered email addresses, ensuring that the email owner remains unaware of the potential attack.

It is also crucial to eliminate any side-channels that an attacker could exploit to differentiate between account existence and non-existence. For example, the response should not be faster for an existing account than for an email with which an account does not exist.

**To mitigate the flaw**, the response must be uniform for both registered and unregistered email addresses. This uniformity must apply to the message displayed to the user as well as the underlying HTTP response details (like status codes, headers, and body content).

For example, the indistinguishable user-facing message could be: "We have sent further instructions to the provided email address". Send an email in both cases, but differentiate the content based on account existence. For example, for new registration, provide means for account activation, and for existing accounts, provide means for account recovery. [2]

**About** This vulnerability report is part of an ongoing study on user enumeration vulnerabilities in Estonian online services. The study is conducted by the University of Tartu master's student Gregor Eesmaa (supervised by Arnis Paršovs - arnis.parsovs@ut.ee). The findings of this study will be published in a master's thesis scheduled for defence in August 2025.
